

NAME	WHAT	STRENGTHS	DISADVANTAGES	HOW WE STAND OUT
GRAMMARLY	<i>AI-powered writing assistant</i>	- Plagiarism Checker - CrossPlatform Integration - Widely recognized	- Surface-Level Feedback - Cost Barrier - Equity Gap (Targets professionals and students the same, not really built around student learning)	- Equity Focus w/ student learning - Iterative Feedback - Lower Entry Cost - Specialized Feedback
QUILL BOT	<i>AI-powered online platform and writing assistant</i>	- Popular and well-known writing-assist product. Established market standing - Versatile paraphrasing modes - Reasonable Value - Multiple Language support & translation	- Most sought after features are blocked behind a paywall or premium features - Lacks deep structural feedback / high-level guidance - Mismatched context, tone and voice suggestions	<i>Strong free tier to drive viral adoption among students</i> - Education first positioning. Meaning guided feedback that maps common rubrics so students and instructors see measurable learning outcomes. - Deeper Feedback on Structure & Argument
CHATGPT	<i>General-purpose AI chatbot created by OpenAI</i>	- Versatile. Able to handle a broad range of tasks beyond writing feedback. - Widely recognized and heavily used - Advanced AI. ChatGPT is built on powerful GPT models with a strong understanding of language and tone	- Not specialized for students but rather general audience - Lack on "in-line" comments. Responses are given as paragraphs or lists without the visual editing - High paywall, not accessible. Once freemium model reaches limit, higher use/ tools are hidden behind a paywall of \$20 a month, making it too expensive for some.	- In-line text suggestions and comments. - Student focused & equity driven - Specialized modes for writing material and suggestions - Community created. For students, by students.

Currently Classmate operates on a B2C model, with a freemium model included. However in the near future Classmate will operate on a Business-to-Business model (B2B) to alleviate financial burden from students and to influence maximum use.

Within the B2B model, schools are projected to pay an annual per-student license fee: of about \$3-\$8 per year. Pricing tiers may be adjusted based on school size, type (charter, private, public), and level of support provided

Problem Statement

High school students lack accessible, effective writing support. Private tutors and counselors often come at a high cost, while existing AI tools provide feedback that is generic and not conducive to genuine learning.

At the same time, schools face the challenge of guiding students in the responsible use of AI. Outright bans are impractical, yet current chat-based models offer limited educational value and inadequate writing-specific support.

How high is up

TAM

Total available Market

The writing tool and AI market is a growing billion dollar industry. We are looking at every single person that uses software to help edit and improve their writing samples. Geared more towards students it has an estimate of \$10 billion dollars globally.

SAM

Serviceable Available Market

We will be able to gain access to everyone that wants help to increase the quality of their writing. Our potential market group consists of 36 million American students with a projected earning of around \$40 million.

SOM

Serviceable Obtainable Market

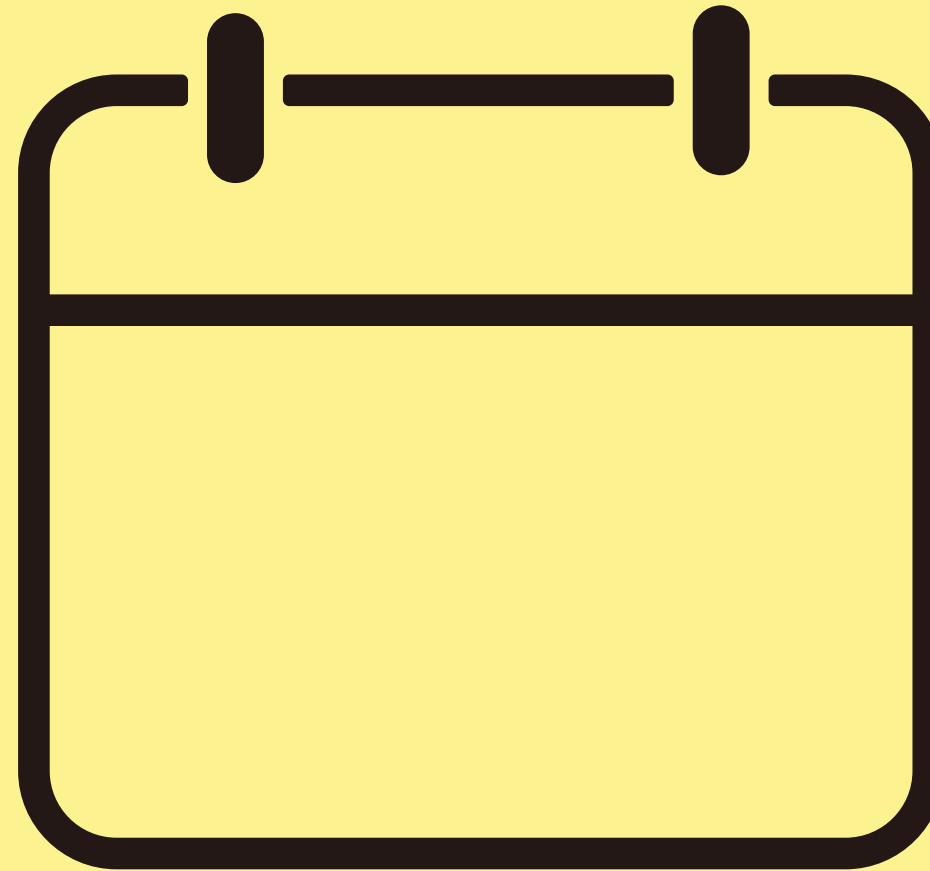

Focusing on high schools as our lead consumer, we would want to focus on the 2 million C private and charter students and the 40,000 schools that are located in the United States. This would be a projected revenue of \$10 million.

Team Culture Documents

Values and mission

Team Scheduling

We are in weekly if not daily communication with one another about expectations and assignments that need to get done for classmate.

We all discuss what we have going on during the week and anything one person is not able to do someone steps up and as a team we make sure our duties to Classmate don't fall behind.

User Research Findings

- 1.** Feedback from other AI applications for similar use give generic feedback where students are unsure of how to apply it
- 2.** Curiosity drives initial adoption, but usefulness drives retention. If AI doesn't deliver real value within the first few uses, people stop.
- 3.** Customization is highly desired. Users want AI that “remembers” preferences and adapts to their style.

Early Validation & User Testing

- **Students want everything in one place — a single platform for writing, feedback, and improvement.**
- **Users want to upload full-length documents and maintain continuous AI interactions, rather than starting new sessions for each question.**
- **Students & Educators look for a streamlined system to engage in continuous, instant rubric-aligned feedback**

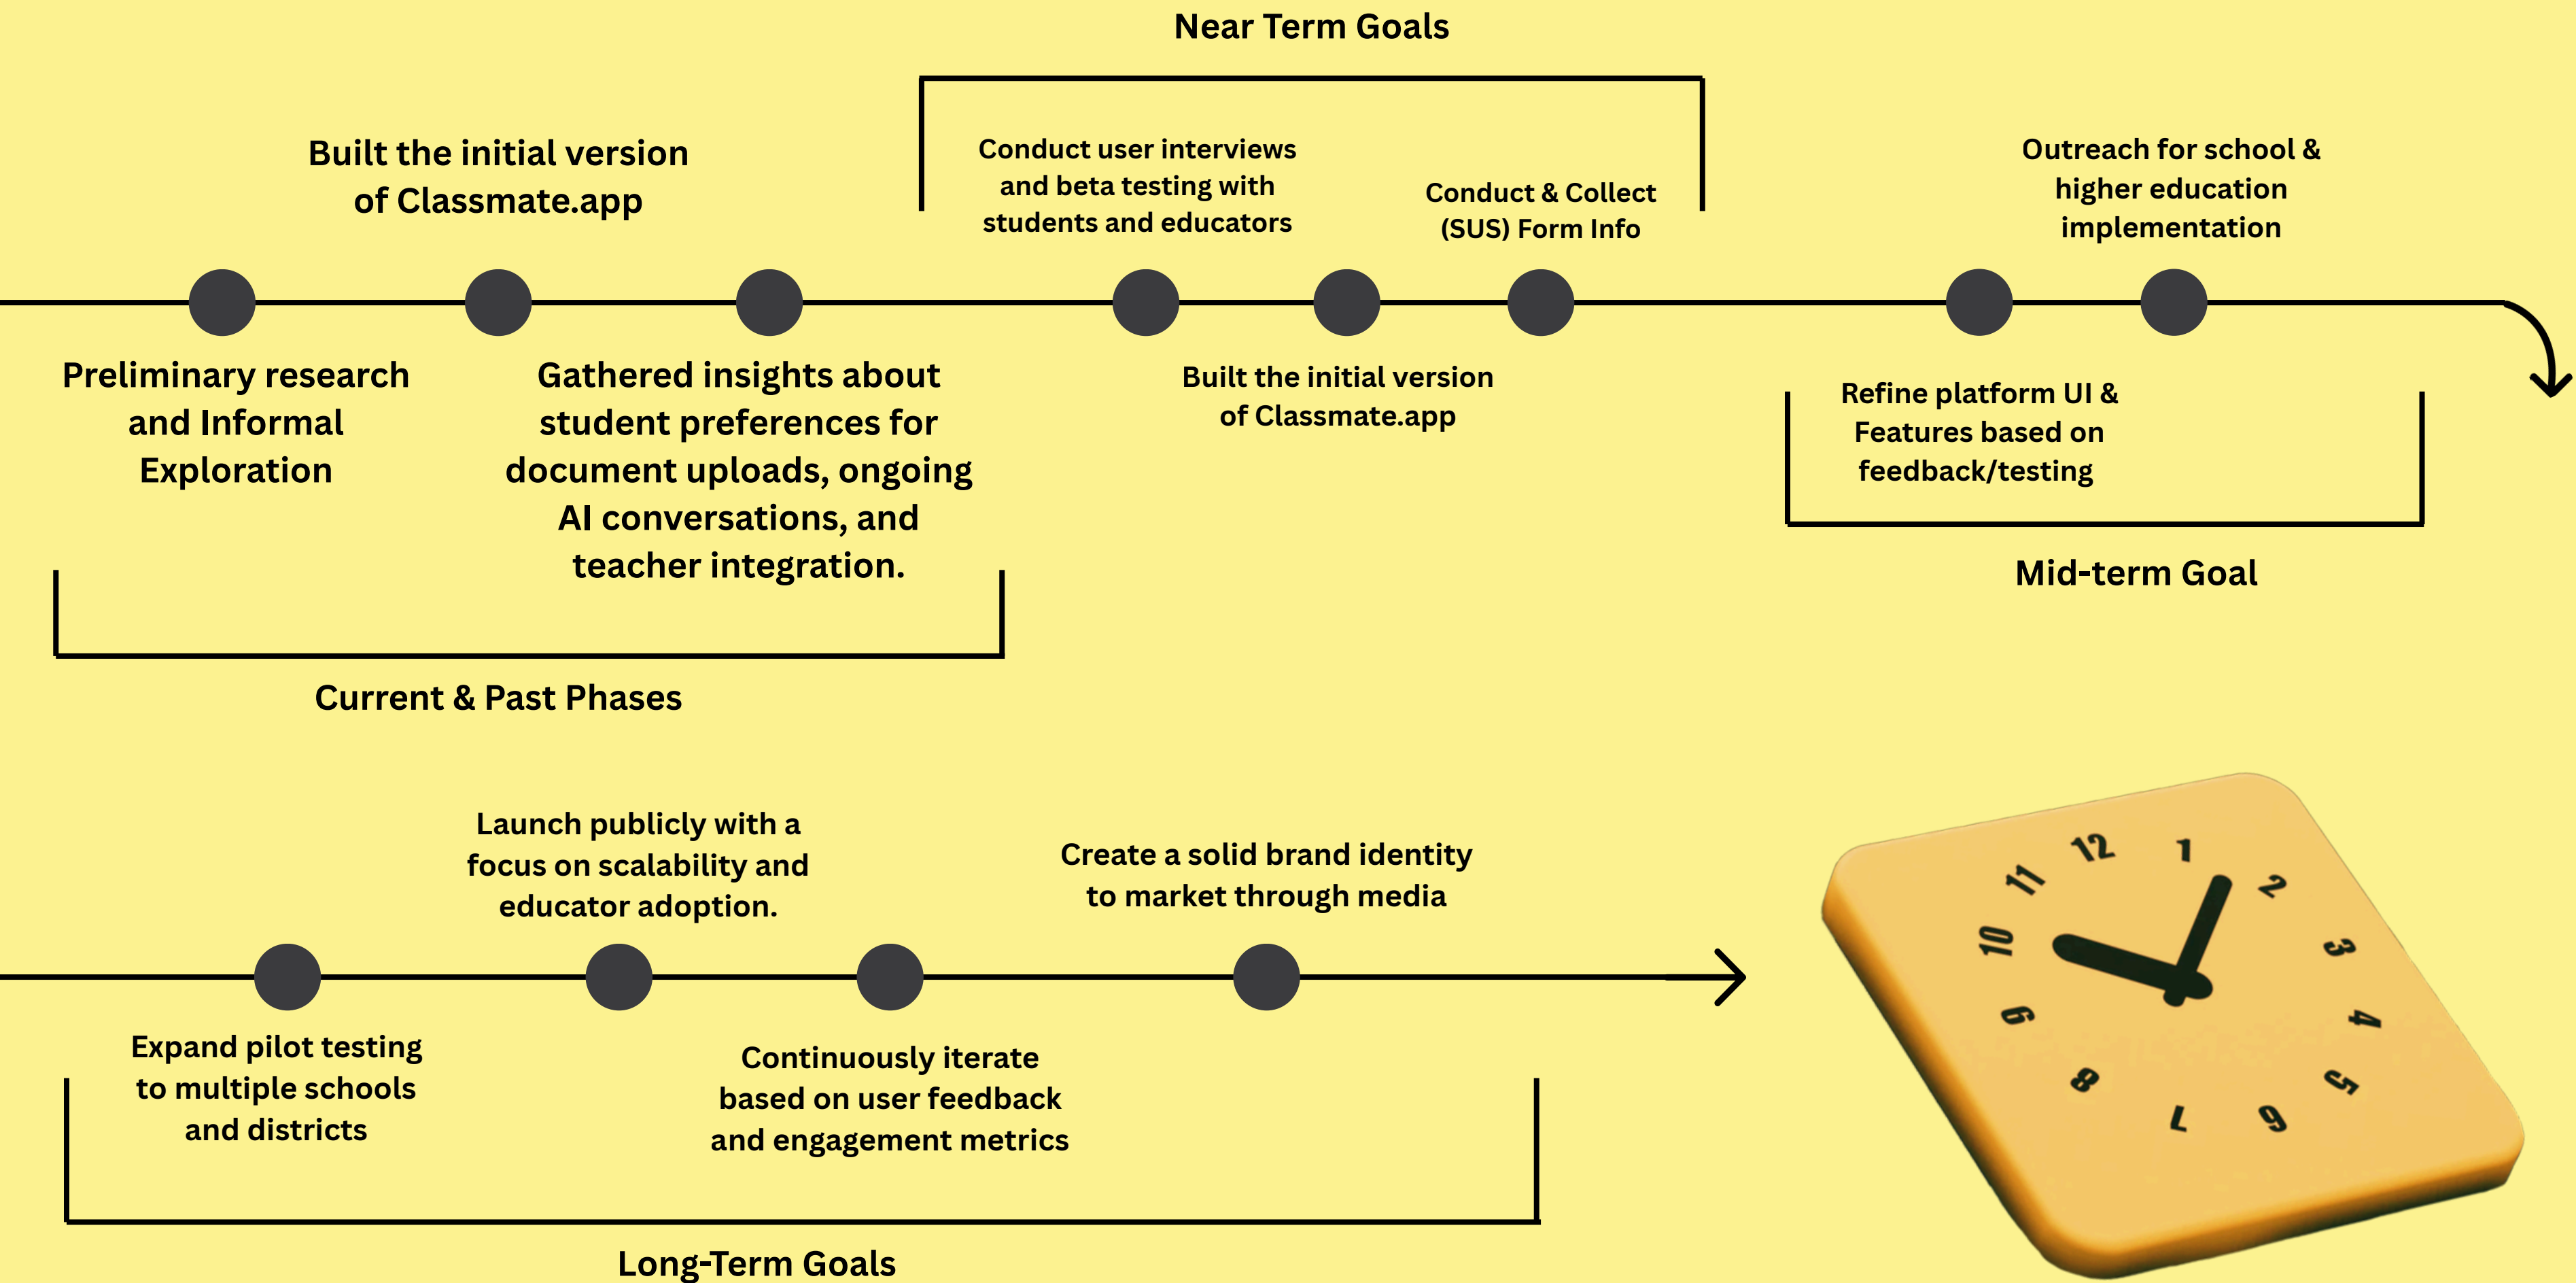

System Usability Scale

***Currently in early development phase of Classmate.app and have not yet conducted formal usability testing.
Planned questionnaire below***

User Growth & KPIs

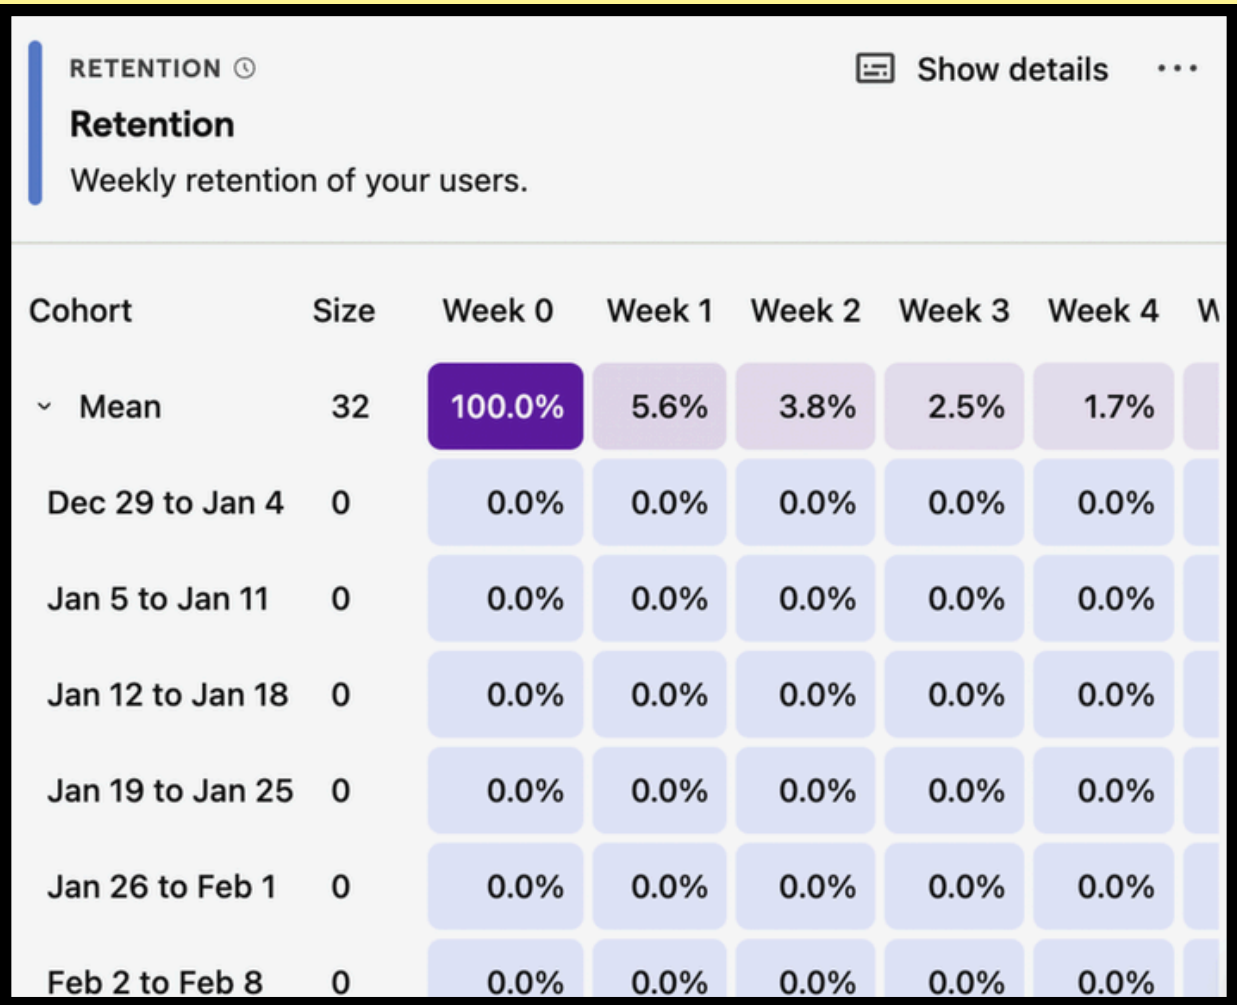

(Information Displayed Monthly)

Daily Active Users:

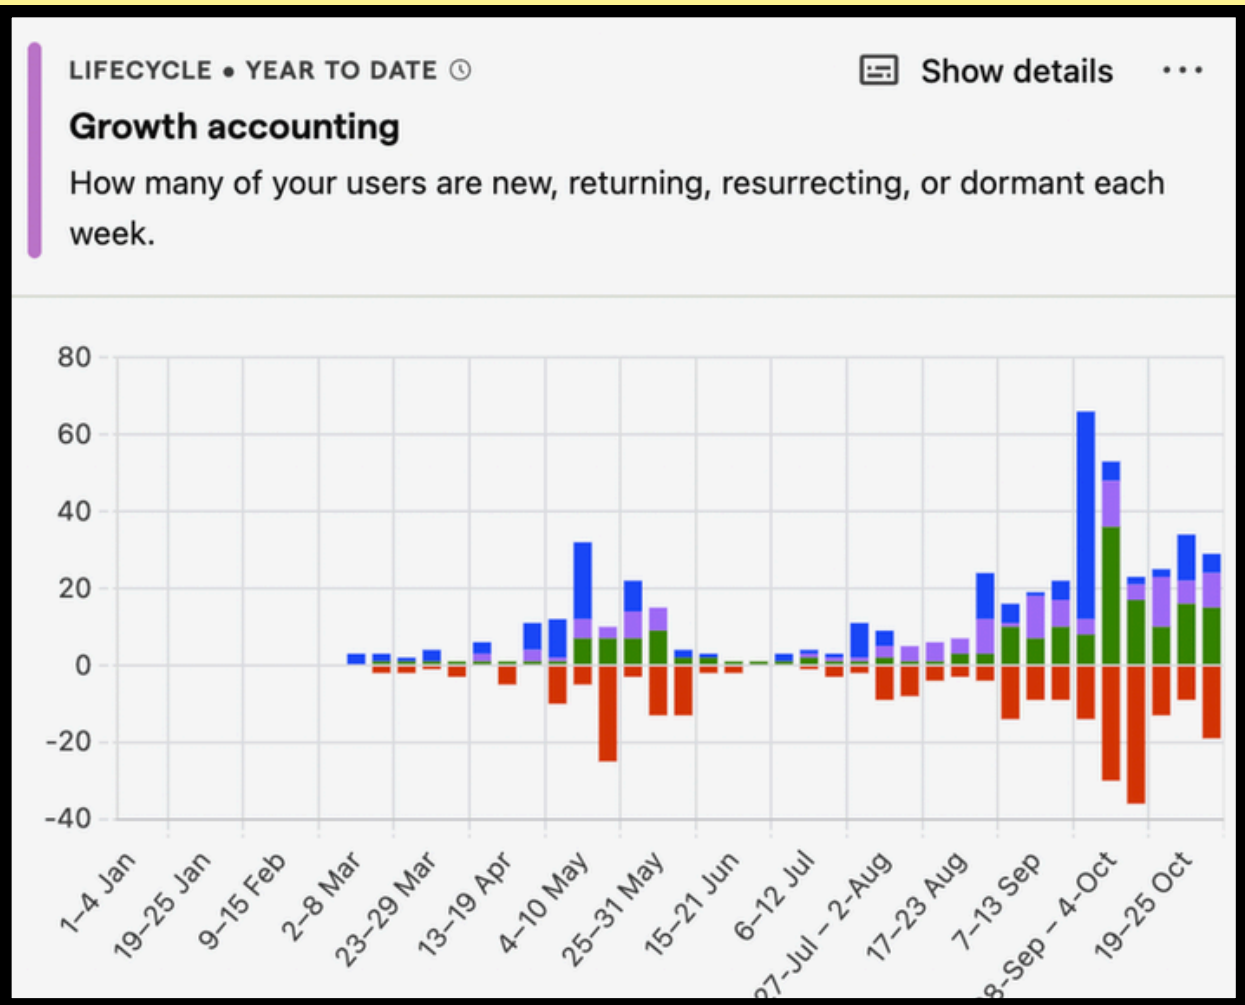

Daily active users are rising gradually, with consistent spikes in usage that indicates group/classroom activity. Overall engagement is trending upward as the product gains traction.

User Retention:

User retention currently averages 5.6% after the first week, suggesting strong initial curiosity but limited ongoing engagement — improving the user journey or classroom integration could boost this.

User Growth:

Recent months show strong re-engagement and new user acquisition, with more users returning to the app and fewer dropping off — a positive sign of growing user loyalty.

Progress Toward Product Market Fit

Because we are unaware if classmate.app has reached a product-market fit, here are our steps toward that fit:

Signs of Real User Growth:

- User growth: Weekly Active Users grew 5× since launch
- User Retention Rate is gradually increasing weekly
- Recieving Positive Feedback from Users

GAPS:

- Refining our retention
- Experimenting with teacher-led workflows to make usage recurring & classroom adaption simpler
- Collecting feedback to better align our features with real classroom needs
